📓 EXP-02

🎯 AIM:

To write a **JavaScript program to validate user input** in a **Travel Planning Website Registration Form**. The validation ensures that the user-entered details such as name, password, email, mobile number, and address follow proper formats and constraints, thereby maintaining data accuracy and preventing invalid submissions.

▯ ALGORITHM:

Step 1: Input

- The user enters the following details in the registration form:
  - First Name
  - Last Name
  - Password
  - E-mail
  - Mobile Number
  - Address

Step 2: Validation Process

1. **Validate First Name**
   - Check whether it contains only alphabets
   - Ensure it has a minimum length of 6 characters
   - Display an error message if invalid
2. **Validate Last Name**
   - Check whether the field is not empty
   - Display an error message if empty
3. **Validate Password**
   - Ensure the password has at least 6 characters
   - Display an error message if invalid
4. **Validate E-mail**

- Use regular expression to verify format (name@domain.com)
- Display error if format is incorrect

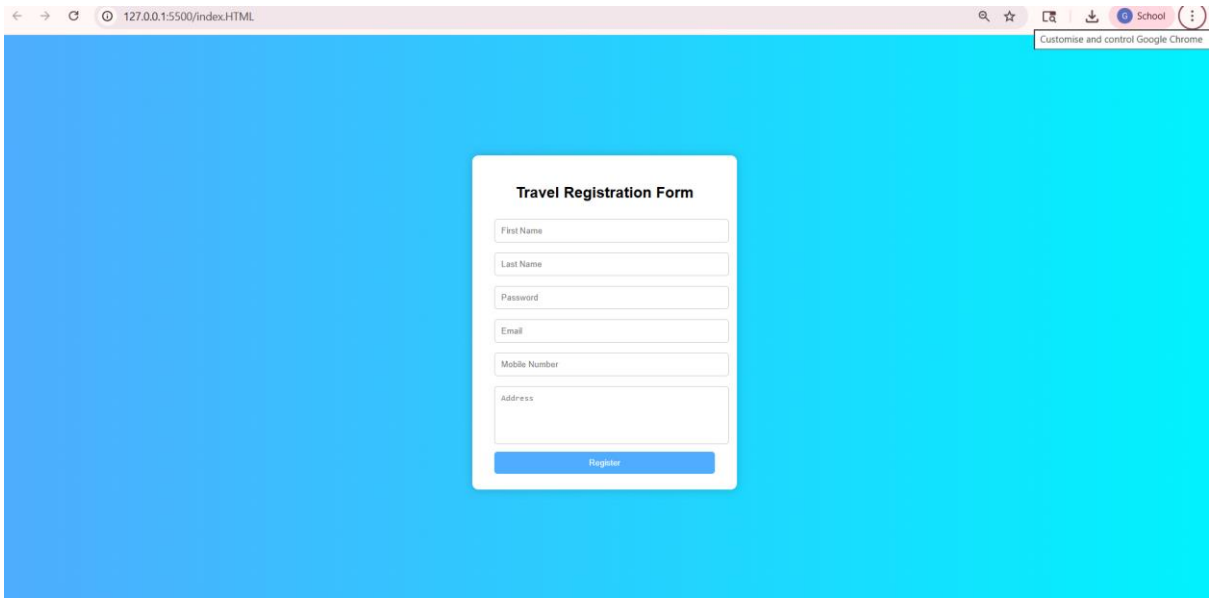
5. **Validate Mobile Number**
    - Ensure it contains exactly 10 digits
    - No alphabets or special characters allowed
    - Display error if invalid
6. **Validate Address**
    - Ensure the address field is not empty
    - Display error message if empty

Step 3: Output Handling

- If any validation fails → show respective error messages
- If all inputs are valid → display success message

OUTPUT:

- A **Travel Planning Registration Form** is displayed
- User enters personal details
- Appropriate error messages are shown for invalid inputs
- On correct input, a **successful registration message** is displayed



✅ **RESULT:**

Thus, the **HTML Registration Form for the Travel Planning Website** is successfully created and validated using **JavaScript**, ensuring that all user inputs meet the required conditions before submission.
